**(54) Watch-case with crown**

(57) The watch-case comprises a caseband (1) having a radial orifice (25), through which there passes a stem ending in a crown and a groove (30) formed as a lateral opening (31). A bridge (6) situated in the lateral opening is solid with a means of attachment (35) (Fig. 4a) having a shape which enables it to be fitted into the groove (30). The bridge (6) surrounds and protects the crown (4) by means of an aperture (9). The radial orifice (25) may be provided with a pipe (24) which, together with the crown (4), forms a watertight joint. The bridge is notched at (36) to fit around the pipe (24).
